GUIDE

To make the most of your Nuura lamp, it is essential to use a quality light source with specifications that meet your needs. Consider whether the light source should provide soft or intense light, and if the lamp should be dimmable - these factors will help you select the appropriate light source.

In this guide, we have outlined our recommendations for light sources for each Nuura lamp. These recommendations are based on several criteria: To ensure that the light source illuminates beautifully and evenly within the lamp. To ensure that the light source does not cause glare. To ensure that the light source provides adequate brightness. To ensure that the light source is of high quality. To ensure that the light source is efficient and energy-saving.

Please note that all specifications regarding the light sources in this document have been provided by the light source supplier. For further specifications and technical information concerning the light sources and dimming options, please refer to the supplier.

Certain light sources are intended only for private use, while others are developed for the contract market. Light sources marked as contract usage can also be used in private settings, whereas light sources marked as private usage cannot be used for contract purposes.

Nuura always recommends LED light sources due to their energy efficiency and long lifespan. Generally, dimmable light sources are recommended to ensure optimal use of the light source and to create a specific ambiance that contributes to improved wellbeing.

Please note that the energy classification is indicated per light source and only represents the efficiency of the light source, not the entire lamp.

Light source glossary

Lumen: Indicates how much light the light source emits. The higher the number, the more light is produced.

CRI (Color Rendering Index): Shows how accurately colors are rendered under the illumination of the light source. The closer the CRI value is to 100, the better the color rendering. Nuura does not recommend light sources with a CRI below 80.
